

Sunburst Eclipse Awning

Need a new fabric for your existing roll out awning? We will make it! (All Awning Types)

Aussie Traveller's Sunburst Eclipse awning is for the discerning buyer looking for a combination of quality and value.

The Sunburst Eclipse awning was initially supplied from North America prior to Aussie Traveller Pty Ltd purchasing and relocating the plant and tooling to Australia. Its basic operation follows similar commonly used roll out awnings which are imported from America but its components and construction are far more robust giving a long lasting awning with minimum operating problems.

Available in all standard lengths and we will custom make to your required size, e.g. 11'7-1/3" if you need to clear windows/vents etc.

Sunburst Eclipse Awnings - Fact Sheet

Both Models ECLIPSE AND CLASSIC
The best of this style of awning
in Australia!

Powder-coated framset to match your van

The Sunburst Awning has its origins in North America but unlike its fully imported competitors, Aussie Traveller now manufactures the Sunburst in Australia. We took the opportunity that arose to purchase the plant and equipment from our previous overseas supplier and established it here in our Brisbane factory.

Now you have the opportunity of purchasing the best "American Style" awning in the world - the Sunburst Awning - made here in Australia.

The quality of the componentary and the design of the awning makes the Sunburst Awning superior in many areas. Some of these features are highlighted below.

It is superior in the following areas.

- The design and configuration to its frameset. The four telescopic components of the frameset structure have been engineered for superior overall strength and ease of telescoping without adversely affecting the finish on the powder coated surfaces.
- One of the most common complaints received on all these styles of American rollout awnings is their proneness to rattle in a breeze. These rattles generally emanate at the extremities of the topmount bracket and rafter arm ends. Aussie Traveller have added bushes to these positions and coupled with unique spring fixing at the rafter/roller junctions this rattling has been largely overcome.
- Similarly, a rubber buffer is positioned between the inner rafter arm and the outer leg. When the frameset is folded for travelling, this rubber buffer, in unison with our unique sliding travel lock, renders the awning rattle/vibration free
- The frameset control handle has a childproof two step release system. This prevents the frameset being idly tampered with. The first action of lifting the handle does not release the locking pin which can only be disengaged by the second stage trigger action.
- The roller lock/unlock is a ratchet action which is superior to the camlock action of most other awnings. In addition, the roller lock on the Classic is able to be actioned via a remote switch located on the right hand side frameset at an accessible height. This eliminates the need to reach up to the lock/unlock lever on the roller itself.
- The specially engineered frameset components, not only provide superior strength, but have built in wear ridges which eliminate broad rub surfaces when the frameset is erected and demounted. This isolates any wear on the powder coated surfaces to a minimum.
- The Classic roller ends have protective shrouds attached which not only add to the cosmetic appearance but provide some protection to the roller from overhanging branches and/or dust and rain entering the fabric roll when travelling.

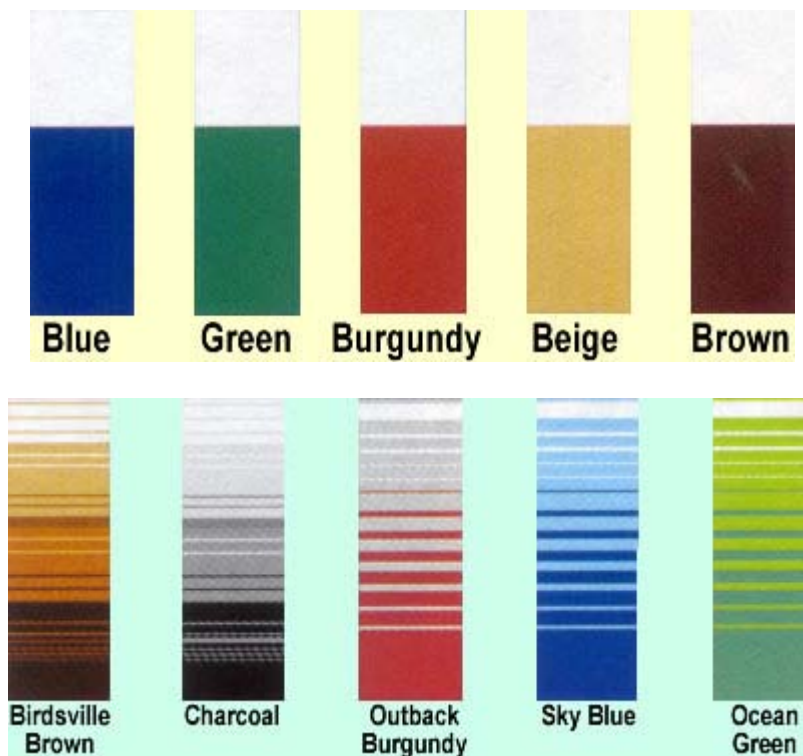

- In addition to the above, the fact that the awnings are manufactured locally makes parts and componentary readily available in the event they are required. Unlike our competitors, it is our policy where possible to make available individual parts rather than complete components - this greatly reduces the cost of minor repairs.

The unique four layer fabric offers you total block-out protection

Sunburst Fabrics

Plain or striped? Now that's a decision - maybe it's best left to the lady of the house. That way the guys can't get into trouble!

Both plain colours and striped colours have a white 16 ox weathershield top. The colours here are an indication only and you will need to look at them physically to see the exact tones.
